

Shape of the tuning curve

Rasmus Munter

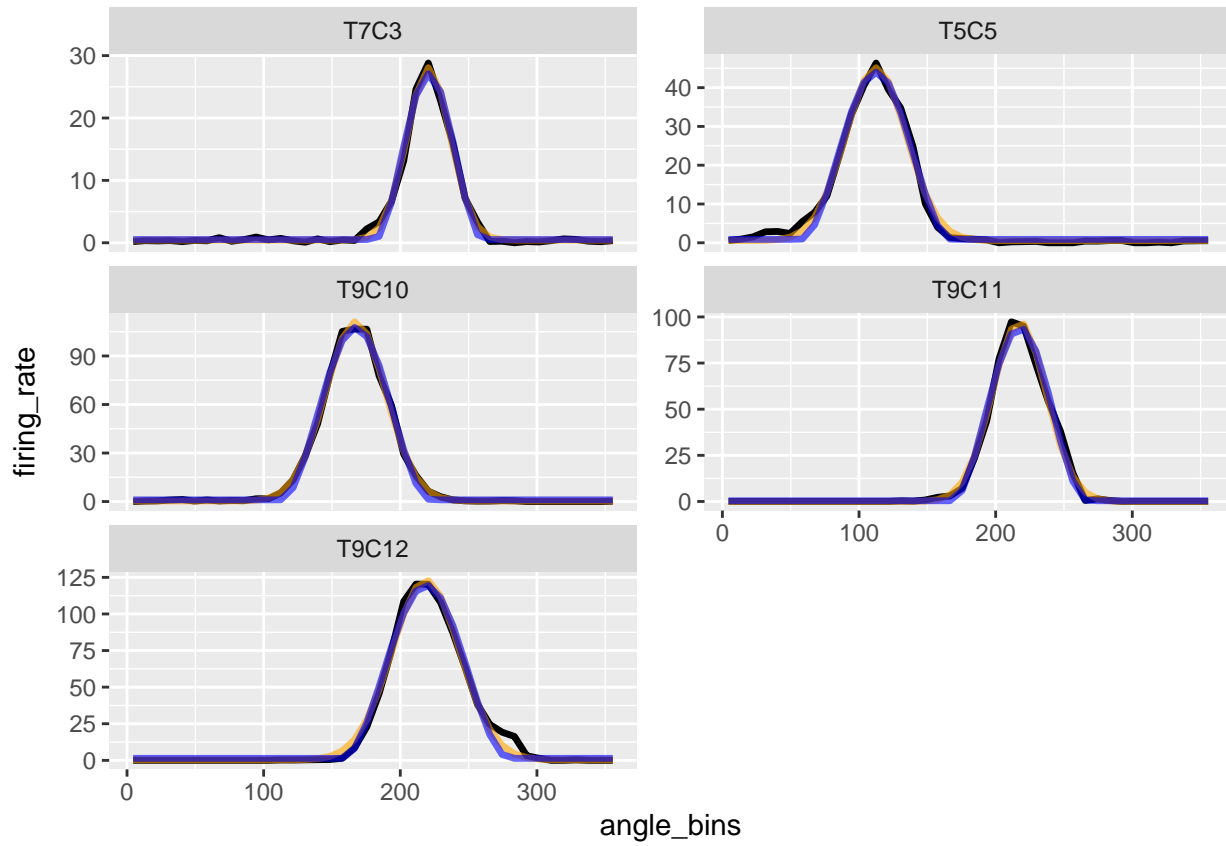

May 11, 2018

For each of the 10 neurons found in the previous project a gaussian and cosine function was fit.

Cortex cell model

Thalamus cell model

For most cells both models proved effective. The only two exceptions are cell T5C3 and T7C4 where the gaussian estimate fit, but the cosine fit failed. However, both these cells are from the subiculum where the measurements are noisy.
